Version 7

Three changes from Version 6, and the benefit of each

The caller is the same model in both versions, sarvam-105b-conversations. When the model is called, it still takes about 0.8 seconds. Version 7 changes when speech starts, when the model is called, and when the call is allowed to end.

1 Speech starts on the first clause

Version 6	The whole reply is synthesized. Playback starts only after that clip is ready.
Version 7	The first clause plays as soon as it is ready. The later clauses are prepared while that clause is being spoken.
Benefit	**Speech starts about 2 seconds sooner. The median wait before voice falls from 3.39 seconds to 1.26 seconds.**

2 Known lines skip the model

Version 6	The model is called on about half the turns: 8 of 15 across the three saved calls.
Version 7	The greeting, the configuration question, an open answer, and the visit line are spoken from a fixed line. The model is used when the reply is not already known.
Benefit	**Those turns have no model wait. The 5:45 PM call called the model once in four turns. The 5:35 PM call called it three times in twelve.**

3 The call can close

Version 6	Finishing one topic often produced another question. A no to the project could still be followed by a new offer.
Version 7	A no to configuration or size can still hear the visit once. A no to the project, a deferred visit, or “I don’t need any details” is one goodbye and no further question. A yes to highlights arranges the details. It does not book a day.
Benefit	**The 4:58 PM call was still choosing a day after 13 turns. The 5:45 PM call has no repeated question and no early visit.**

The Version 7 voice time is the moment Ishita starts, not the time to finish every later clause. Version 6’s voice time is the full clip before playback. Speech to text is the same path in both.

Saved localhost calls, 12–14 October 2026. The longer comparison is the Version 6 and Version 7 evaluation of the same date.

The latency benefit

Medians from every saved turn. The mean is in parentheses. Times are seconds.

	Speech to text	Model	Voice	Whole turn
Version 6, all calls	1.03 (1.14)	0.84 (0.86)	3.39 (5.02)	4.58 (6.39)
Version 7, all calls	0.89 (0.90)	0.80 (0.84)	1.26 (1.40)	2.44 (2.56)
Version 6, four turns or more	0.99 (1.14)	0.80 (0.82)	3.27 (4.75)	4.45 (6.16)
Version 7, four turns or more	0.90 (0.91)	0.80 (0.85)	1.23 (1.38)	2.45 (2.61)

The whole turn falls from 4.58 seconds to 2.44 seconds. On calls of four turns or more it falls from 4.45 seconds to 2.45 seconds. The mean for Version 6 is higher because one voice clip on 12 October at 2:31 PM took 22.6 seconds. The median is the figure to use.

What is still open

The 5:45 PM call is clean on the conversation checks. Configuration is left open, each reply asks one question, nothing is repeated, and no visit is offered early. Two checks still fail, both on turn 4. After an investment answer, the reply restates Electronic City and names SOBHA Hamptons and SOBHA Madison Heights.

The 5:48 PM call claims 984 residences, which is also not supplied. The 5:35 PM call still repeats a question and offers the visit while an earlier question is open. The latency benefit is already on these calls. The remaining work is keeping the model sentence inside the supplied facts.
