

Viewing the AI Calling Agent in Cursor

8 October 2026

This project is public. Open the link below in Cursor to read the files. No invite is required.

<https://github.com/NishanthHanumantha/AI-Calling-Agent>

Open the project

Install Cursor from cursor.com if it is not already installed. Then:

1. Open Cursor.
2. On the start screen, choose Clone Repo. If that button is not visible, press Ctrl+Shift+P, type Git: Clone, and press Enter. On a Mac, use Cmd+Shift+P.
3. Paste the GitHub link above and press Enter.
4. Choose a folder on the computer, such as Documents, and let the download finish.
5. When Cursor asks whether to open the project, choose Open.

If GitHub asks for a sign-in, complete it in the browser and return to Cursor. A public project can also be downloaded from the green Code button as a ZIP, then opened with File, Open Folder. Cloning is the clearer path.

Find a file

1. The file list is the Explorer on the left. If it is hidden, press Ctrl+Shift+E. On a Mac, use Cmd+Shift+E.
2. Click a folder name to expand it. Click a file name to open it.
3. To jump to a file by name, press Ctrl+P (Cmd+P on a Mac) and start typing the name, for example app_v3.py.
4. To search inside files, press Ctrl+Shift+F (Cmd+Shift+F on a Mac) and type a word such as greeting.

Reading a file does not change it. If text is typed by accident, press Ctrl+Z, or close the file and choose Don't Save.

Where to start

Start in Version4. That is the current work. Version3 is a frozen copy kept for comparison.

Open this	What it is
Version4/VERSION_BASELINE.md	Why Version3 is frozen and Version4 is the working copy.
Version4/app_v3.py	The phone conversation: greeting, qualification, answers, and the site visit.
Version4/local_call/index.html	The browser call page used in Cursor.
Version4/local_call/server.py	The local call server for that page.
Version4/local_call/evaluate.py	Scores a finished local call.
Version4/local_call/judge.py	The separate judge used by the scorecard.
Version4/local_call/scorecard.py	Writes the scorecard after a call.
Version4/README.md	Short project overview.
Version4/Setup_Instructions.md	How the phone service is set up. Read this. Do not change the live service.
Version3/	Frozen comparison copy. Read it. Do not edit it.

What is not in the link

API keys are not in the project. The .env files stay on the original machine. Saved local-call recordings and scorecards are also not in the link. Opening the project is enough to read the code. Running a call needs keys that are supplied separately.
